

Intelligent Technology

The secret to Baseline's biLine two-wire technology lies in Baseline's patented biCoders™ (two-wire decoders). Baseline's biCoders are the only true bi-directional two-wire devices in the industry because Baseline's biCoders not only receive commands from the controller, they also send real-time information back to the controller.

Plus, Baseline's biCoders have built-in diagnostic LED lights that tell you at a glance whether the device is working.

Lightning Arrestor

"As a city that must enforce watering bans and charge extra for irrigating, we asked ourselves what we could do to lead the way in water conservation and labor savings.

For the past six years, Baseline has provided us the conservation and labor savings results we needed."

- Pete Hammerlind, City of Eden Prairie, MN

This smart technology also enables you to assign any biCoder to a zone or function from the controller after the biCoder has been installed. With a multi-station biCoder, you can assign any station to any zone, in any order. These features will save you hundreds of hours because Baseline has eliminated the need for expensive programming equipment or multiple trips into the field just to assign zones to a device. Diagnostics and repairs become a whole lot easier too.

Baseline's biLine technology and biCoders can operate up to 15 zones concurrently at distances farther from the controller than any other product on the market. More zones running means a shorter water window, and a greater allowable wire length means fewer controllers to manage.

Dynamic Solutions

Multiple biCoders serving multiple functions

- Multi-station controls
- Lightning arrestors
- Coach's buttons
- Pump controls
- Mastervalves
- Flow sensors

Choose Baseline's biLine™ two-wire technology for your next irrigation project and you'll save more time and more money. Not only are there fewer wires to keep track of, fewer wires to troubleshoot, and fewer wires to repair; with Baseline's biLine technology, you also get more features that really matter like longer wire distances, more concurrent valve operations, and better diagnostic features.
